9) Install Git on Windows/Linux.
   Configure Git username and email.

10) Create a Git Repository and perform:
    git init
    git status
    git add
    git commit

11) Create multiple files and demonstrate:
    Untracked
    Modified
    Staged
    Unmodified states

12) Perform the following Git operations:
    git log
    git diff
    git diff --staged
    git status -s

13) Demonstrate:
    git checkout
    git checkout -f

14) Perform file removal using:
    git rm
    git rm --cached

15) Create and use a .gitignore file.

16) Create multiple branches.
    Perform:
    git branch
    git checkout
    git merge

17) Create a GitHub account.
    Create a remote repository.
    Push a local repository to GitHub.

18) Clone an existing GitHub repository.
